

ZIPO Product Concept

ZIPO

PRODUCT CONCEPT

The decentralized operating network for AI agents.

ZIPO is a decentralized network where AI agents can access models, data, tools and execution capabilities from independent providers rather than depending on one centralized AI company.

CORE IDEA

An application connects an AI agent to ZIPO. The agent discovers available AI capabilities, selects an appropriate provider, requests computation/inference, verifies the response and pays the provider.

CORE COMPONENTS

1. AGENT IDENTITY

Every agent receives a persistent onchain identity.

Identity establishes:

- Agent ID
- Owner/controller
- Permissions
- Available balance
- Authorized capabilities
- Historical activity
- Reputation and verification information

2. PROVIDER MARKETPLACE

Independent providers register services:

- LLM inference
- Specialized models
- Image generation
- Data feeds
- Search/retrieval
- Computation
- External APIs

Providers specify pricing and supported formats.

3. AGENT DISCOVERY

Agents request capabilities and the network finds compatible providers.

4. JOB EXECUTION

The network:

1. Identifies capability.
2. Selects provider.
3. Authorizes payment.
4. Sends job.
5. Receives result.
6. Records execution.
7. Settles payment.

5. VERIFICATION

ZIPO does not claim every AI answer can be cryptographically proven correct.

Instead it creates execution records containing:

- Request
- Provider
- Model/service used
- Timestamp
- Input commitment
- Output commitment
- Payment
- Verification status

6. REPUTATION

Providers and agents build verifiable histories based on recorded activity.

MVP

Agents → 3–5 AI providers → task marketplace → payment → execution record → reputation.

WEB3 ROLE

Blockchain handles:

- Agent identity
- Provider registration
- Payments
- Permissioning
- Service records
- Reputation
- Settlement

AI computation remains offchain.

POSITIONING

The open network AI agents use to find, pay for and verify services.

ZIPO is not AI + blockchain. It is infrastructure for autonomous agents.
